TITLE**OLIGOMERIZATION OF PROPYLENE****FIELD OF THE INVENTION**

Selected cobalt complexes of
5 2,6-pyridinecarboxaldehydebis(imines) and
2,6-diacetylpyridinebis(imines) are catalysts for the
oligomerization of propylene.

BACKGROUND OF THE INVENTION

Oligomers of propylene such as propylene trimer
10 and tetramer are made commercially by several different
processes. These compounds are useful as chemical
intermediates. For instance phenol may be alkylated
with propylene trimer and/or tetramer, and subsequently
ethoxylated to form a commercial industrial detergent.

15 Certain iron and/or cobalt complexes of selected
2,6-pyridinecarboxaldehydebis(imines) and
2,6-diacetylpyridinebis(imines) have been reported in co-
pending applications to polymerize and/or oligomerize
ethylene, see U.S. Patent Applications 08/991372, filed
20 Dec. 16, 1997, and 09/005965, filed Jan. 12, 1998.

Certain iron complexes of selected
2,6-pyridinecarboxaldehydebis(imines) and
2,6-diacetylpyridinebis(imines) have been reported in co-
pending application to polymerize and/or oligomerize
25 propylene, see U.S. Patent Application 09/006031, filed
January 12, 1998.

SUMMARY OF THE INVENTION

This invention concerns a first process for the
oligomerization of propylene, comprising, contacting,
30 at a temperature of about -100°C to about +200°C, a
compound of the formula

with propylene and:

(a) a first compound W, which is a neutral Lewis acid capable of abstracting X^- and alkyl group or a hydride group from M to form WX^- , $(WR^{20})^-$ or WH^- and which is also capable of transferring an alkyl group or a hydride to cobalt, provided that WX^- is a weakly coordinating anion; or

(b) a combination of second compound which is capable of transferring an alkyl or hydride group to cobalt and a third compound which is a neutral Lewis acid which is capable of abstracting X^- , a hydride or an alkyl group from M to form a weakly coordinating anion;

wherein:

each X is an anion;

n is 1, 2 or 3 so that the total number of negative charges on said anion or anions is equal to the oxidation state of a Co atom present in (II);

R^1 , R^2 and R^3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R^4 and R^5 are each independently hydrogen, hydrocarbyl, an inert functional group or substituted hydrocarbyl;

R^6 and R^7 are aryl or substituted aryl; and

R^{20} is alkyl.

This invention also concerns a second process for the oligomerization of propylene, comprising contacting, at a temperature of about -100°C to about

+200°C, a Co[II] or Co[III] complex of a tridentate ligand of the formula

5 with propylene, wherein:

R¹, R² and R³ are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R⁴ and R⁵ are each independently hydrogen, hydrocarbyl, an inert functional group or substituted hydrocarbyl; and

R⁶ and R⁷ are aryl or substituted aryl;

and provided that a Co[II] or Co[III] atom also has bonded to it an empty coordination site or a ligand that may be displaced by said propylene, and a ligand that may add to said propylene.

DETAILS OF THE INVENTION

Herein, certain terms are used. Some of them are:

- A "hydrocarbyl group" is a univalent group containing only carbon and hydrogen. If not otherwise stated, it is preferred that hydrocarbyl groups herein contain 1 to about 30 carbon atoms.
- By "substituted hydrocarbyl" herein is meant a hydrocarbyl group which contains one or more substituent groups which are inert under the process conditions to which the compound containing these groups is subjected. The substituent groups also do not substantially interfere with the process. If not otherwise stated, it is preferred that substituted hydrocarbyl groups herein contain 1 to about 30 carbon atoms. Included in the meaning of "substituted" are heteroaromatic rings.

• By "(inert) functional group" herein is meant a group other than hydrocarbyl or substituted hydrocarbyl which is inert under the process conditions to which the compound containing the group is subjected. The functional groups also do not substantially interfere with any process described herein that the compound in which they are present may take part in. Examples of functional groups include halo (fluoro, chloro, bromo and iodo), ether such as -OR¹⁸ wherein R¹⁸ is hydrocarbyl or substituted hydrocarbyl. In cases in which the functional group may be near a cobalt atom, such as R⁴, R⁵, R⁸, R¹², R¹³, and R¹⁷ the functional group should not coordinate to the metal atom more strongly than the groups in compounds containing R⁴, R⁵, R⁸, R¹², R¹³, and R¹⁷ which are shown as coordinating to the metal atom, that is they should not displace the desired coordinating group.

• By an "alkyl aluminum compound" is meant a compound in which at least one alkyl group is bound to an aluminum atom. Other groups such as alkoxide, hydride, and halogen may also be bound to aluminum atoms in the compound.

• By "neutral Lewis base" is meant a compound, which is not an ion, which can act as a Lewis base. Examples of such compounds include ethers, amines, sulfides, and organic nitriles.

• By "cationic Lewis acid" is meant a cation which can act as a Lewis acid. Examples of such cations are sodium and silver cations.

• By relatively noncoordinating (or weakly coordinating) anions are meant those anions as are generally referred to in the art in this manner, and the coordinating ability of such anions is known and has been discussed in the literature, see for instance W. Beck., et al., Chem. Rev., vol. 88 p. 1405-1421 (1988), and S. H. Stares, Chem. Rev., vol. 93, p. 927-942 (1993), both of which are hereby included by

reference. Among such anions are those formed from the aluminum compounds in the immediately preceding paragraph and X^- , including $R^9_3AlX^-$, $R^9_2AlClX^-$, $R^9AlCl_2X^-$, and " R^9AlOX^- ", wherein R^9 is alkyl. Other useful

- 5 noncoordinating anions include BAF^- (BAF^- = tetrakis[3,5-bis(trifluoromethyl)phenyl]borate), SbF_6^- , PF_6^- , and BF_4^- , trifluoromethanesulfonate, p-toluenesulfonate, $(R_fSO_2)_2N^-$, and $(C_6F_5)_4B^-$.

- By an empty coordination site is meant a
10 potential coordination site that does not have a ligand bound to it. Thus if an ethylene molecule is in the proximity of the empty coordination site, the ethylene molecule may coordinate to the metal atom.

- By a ligand that may add to propylene is
15 meant a ligand coordinated to a metal atom into which an ethylene molecule (or a coordinated ethylene molecule) may insert to start or continue a polymerization. For instance, this may take the form of the reaction (wherein L is a ligand):

20

Note the similarity of the structure on the left-hand side of this equation to compound (IX) (see below).

- By oligomerization is meant that at least 50
25 mole percent of the oligomerized product has 18 or fewer carbon atoms.

Compounds useful as ligands herein in cobalt complexes are diimines of 2,6-pyridinedicarboxaldehyde or 2,6-diacylpyridines of the general formula

30

(IV)

wherein R^1 , R^2 and R^3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group, R^4 and R^5 are each independently hydrogen, hydrocarbyl, an inert functional group or substituted hydrocarbyl, and R^6 and R^7 are aryl or substituted aryl.

(IV) may be made by the reaction of a compound of the formula

(VI)

with a compound of the formula H_2NR^6 or H_2NR^7 , wherein R^1 , R^2 and R^3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group, R^4 and R^5 are each independently hydrogen, hydrocarbyl or substituted hydrocarbyl. Preferably R^4 and R^5 are each hydrogen or hydrocarbyl, and R^6 and R^7 are aryl or substituted aryl. These reactions are often catalyzed by carboxylic acids, such as formic acid.

Preferred compounds of formula (IV) and compounds in which (IV) is a ligand, whether present in compounds such as (I), (II), (VII), (IX) and (XII) a preferred compound is (III), which is a subset of (IV).

(III)

In (III), and hence in (I), (II), (IV), (VII), (IX) and (XII) that match the formula of (III), it is preferred

5 that:

R¹, R² and R³ are hydrogen; and/or

R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵ and R¹⁶ is each

independently halogen, alkyl containing 1 to 6 carbon atoms, or hydrogen, and it is more preferred that each

10 of these is hydrogen; and/or

R¹⁰ and R¹⁵ are methyl; and/or

R⁸ and R¹³ is each independently halogen, phenyl

or alkyl containing 1 to 6 carbon atoms, and it is

especially preferred that each R⁸ and R¹³ is alkyl

15 containing 1-6 carbon atoms, and it is more preferred

that R⁸ and R¹³ are i-propyl or t-butyl;

R¹² and R¹⁷ is each independently halogen,

phenyl, hydrogen, or alkyl containing 1 to 6 carbon

atoms, and it is especially preferred that each R¹² and

20 R¹⁷ is alkyl containing 1-6 carbon atoms, and it is

more preferred that R¹² and R¹⁷ are i-propyl, or it is

especially preferred that R¹² and R¹⁷ are hydrogen;

R⁴ and R⁵ are each independently hydrogen or

alkyl containing 1 to 6 carbon atoms, and it is

25 especially preferred that R⁴ and R⁵ are each

independently hydrogen or methyl.

Also in (IV), and hence in (I), (II), (VII), (IX) and (XII), it is preferred that:

R⁶ is

R⁷ is

5 R⁸ and R¹³ are each independently hydrocarbyl, substituted hydrocarbyl or an inert functional group;

 R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵ and R¹⁶ are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl or an inert functional group;

10 R¹² and R¹⁷ are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl or an inert functional group;

 and provided that any two of R⁸, R⁹, R¹⁰, R¹¹, R¹², R¹³, R¹⁴, R¹⁵, R¹⁶ and R¹⁷ that are vicinal to one another, taken together may form a ring.

15 It is believed that the bulkiness of R⁶ and/or R⁷ become help to determine what oligomers are produced, that is how many propylene molecules are in the resulting oligomer, on average. Another was of stating this is that this bulkiness controls the average molecular weight of the product. It is believed that as R⁶ and/or R⁷ become bulkier, the average molecular weight of the oligomer produced will increase. However, other effects (some unwanted), such as effects on yields may also occur.

 Specific preferred compounds (III) [and also in (I), (II), (IV), (VII), (IX) and (XII)] are:

 R¹, R², R³, R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵ and R¹⁶ are hydrogen, R⁸ and R¹³ are chloro, and R⁴, R⁵, R¹² and R¹⁷ are methyl;

30

$R^1, R^2, R^3, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, R^4 and R^5 are methyl, and R^8 and R^{13} are phenyl;

$R^1, R^2, R^3, R^4, R^5, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, and R^8 and R^{13} are phenyl;

$R^1, R^2, R^3, R^4, R^5, R^9, R^{10}, R^{11}, R^{14}, R^{15}$, and R^{16} are hydrogen, and R^8, R^{12}, R^{13} and R^{17} are i-propyl; and

$R^1, R^2, R^3, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, R^4 and R^5 are methyl, and R^8 and R^{13} are t-butyl.

In the oligomerization processes described herein, it can be seen from the results that it is preferred that there be at least some steric crowding caused by the tridentate ligand about the Co atom. Therefore, it is preferred that groups close to the metal atom be relatively large. It is relatively simple to control steric crowding if (III) is the tridentate ligand, since control of steric crowding can be achieved simply by controlling the size of R^8, R^{12}, R^{13} and R^{16} . These groups may also be part of fused ring systems, such as 9-anthracenyl.

In the first polymerization process it is preferred that X is chloride, bromide and tetrafluoroborate.

In the first polymerization process described herein a cobalt complex (II) is contacted with ethylene and a neutral Lewis acid W capable of abstracting X^- , hydride or alkyl from (II) to form a weakly coordinating anion, and must alkylate or be capable of adding a hydride ion to the metal atom, or an additional alkylating agent or an agent capable of adding a hydride anion to the metal atom must be present. The neutral Lewis acid is originally uncharged (i.e., not ionic). Suitable neutral Lewis acids include SbF_5 , Ar_3B (wherein Ar is aryl), and BF_3 . Suitable cationic Lewis acids or Bronsted acids include NaBAF, silver trifluoromethanesulfonate, HBF_4 , or $[C_6H_5N(CH_3)_2]^+ [B(C_6F_5)_4]^-$. In those instances in which

(II) (and similar catalysts which require the presence of a neutral Lewis acid or a cationic Lewis or Bronsted acid), does not contain an alkyl or hydride group already bonded to the metal atom, the neutral Lewis
5 acid or a cationic Lewis or Bronsted acid also alkylates or adds a hydride to the metal or a separate alkylating or hydriding agent is present, i.e., causes an alkyl group or hydride to become bonded to the metal atom.

10 It is preferred that R^{20} contains 1 to 4 carbon atoms, and more preferred that R^{20} is methyl or ethyl.

For instance, alkyl aluminum compounds (see next paragraph) may alkylate (II). However, not all alkyl aluminum compounds may be strong enough Lewis acids to
15 abstract X^- or an alkyl group from the metal atom. In that case a separate Lewis acid strong enough to do the abstraction must be present. For instance, in Example 39, polymethylaluminoxane is used as the "sole" Lewis acid, it both alkylates and does the abstraction from
20 the metal atom.

A preferred neutral Lewis acid, which can alkylate the metal, is a selected alkyl aluminum compound, such as R^{20}_3Al , $R^{20}AlCl_2$, R^{20}_2AlCl , and " $R^{20}AlO$ " (alkylaluminoxanes), wherein R^{20} is alkyl containing
25 1 to 25 carbon atoms, preferably 1 to 4 carbon atoms. Suitable alkyl aluminum compounds include methylaluminoxane (which is an oligomer with the general formula $[MeAlO]_n$), modified $[MeAlO]_n$ wherein a minority of the methyl groups are replaced by another
30 alkyl group, $(C_2H_5)_2AlCl$, $C_2H_5AlCl_2$, and $[(CH_3)_2CHCH_2]_3Al$.

Metal hydrides such as $NaBH_4$ may be used to bond hydride groups to the metal M.

In the second polymerization process described herein a cobalt complex of (I) is either added to the
35 polymerization process or formed in situ in the process. In fact, more than one such complex may be formed during the course of the process, for instance formation of an initial complex and then reaction of

that complex to form a living ended polymer containing such a complex.

Examples of such complexes which may be formed initially in situ include

5

(VII)

and

(XII)

wherein R^1 through R^7 are as defined above, T^1 is hydride or alkyl or any other anionic ligand into which propylene can insert, Y is a neutral ligand capable of being displaced by propylene or a vacant coordination site, and Q is a relatively non-coordinating anion. Complexes may be added directly to the process or formed in situ. For instance, (VII) may be formed by the reaction of (II) with a neutral Lewis acid such as an alkyl aluminum compound. Another method of forming such a complex in situ is adding a suitable cobalt compound such as cobalt [II] acetylacetonate, (I) and an alkyl aluminum compound. Other metal salts in which

10

20

anions similar to acetylacetonate are present, and which may be removed by reaction with the Lewis or Bronsted acid. For instance metal halides and carboxylates (such as acetates) may be used,
 5 particularly if they are slightly soluble in the process medium. It is preferred that these precursor metal salts be at least somewhat soluble in the process medium.

After the propylene oligomerization has started,
 10 the complex may be in a form such as

(IX)

wherein R¹ through R⁷, and Q are as defined above, and
 15 P is a divalent (oligo)propylene group, and T² is an end group, for example the groups listed for T¹ above. Those skilled in the art will note that (IX) is in essence an oligomer containing a so-called living end. It is preferred that Co be in +2 oxidation state in
 20 (VII), (VIII) and (IX). Compounds such as (VII), (IX) and (XII) may or may not be stable away from an environment similar to that of the polymerization process, but they may be detected by NMR spectroscopy, particularly one or both of ¹H and ¹³C NMR, and
 25 particularly at lower temperatures. Such techniques, especially for polymerization "intermediates" of these types are known, see for instance World Patent Application 96/23010, especially Examples 197-203, which is hereby included by reference.

30 In all the oligomerization processes herein, the temperature at which the propylene oligomerization is

carried out is about -100°C to about +200°C, preferably about -60°C to about 150°C, more preferably about -50°C to about 100°C. The propylene pressure at which the polymerization is carried out is not critical,
5 atmospheric pressure to about 275 MPa being a suitable range.

The oligomerization processes herein may be run in the presence of various liquids, particularly aprotic organic liquids. The catalyst system, propylene, and
10 propylene oligomer may be soluble or insoluble in these liquids, but obviously these liquids should not prevent the oligomerization from occurring. Suitable liquids include alkanes, cycloalkanes, selected halogenated hydrocarbons, (liquid) propylene and aromatic
15 hydrocarbons. Specific useful solvents include hexane, toluene and benzene. A preferred liquid is the propylene oligomer itself.

The propylene oligomerizations herein may also initially be carried out in the solid state [assuming
20 (II), (IV) or (VII) is a solid] by, for instance, supporting (II), (IV) or (VII) on a substrate such as silica or alumina, activating it with the Lewis (such as W, for instance an alkylaluminum compound) or Bronsted acid and exposing it to a polymerizable or
25 oligomerizable olefin. An alternative method is to react or treat the support with W, then react the treated support with (II), (IV) or (VII). Or W and (II), (IV) or (VII) can be mixed and then the support treated with the resulting solution. The support may
30 also be able to take the place of the Lewis or Bronsted acid, for instance an acidic clay such as montmorillonite. Another method of making a supported catalyst is to start a polymerization or at least make a cobalt complex of another olefin or oligomer of an
35 olefin such as cyclopentene on a support such as silica or alumina. These "heterogeneous" catalysts may be used to catalyze oligomerization in the gas phase or the liquid phase. By gas phase is meant that the

propylene is transported to contact with the catalyst particle while the propylene is in the gas phase.

In the Examples and Experiments, the pressures
5 given are gauge pressures. The following abbreviations and terms are used:

Branching - reported as the number of methyl groups per 1000 methylene groups in the oligomer. Not corrected for end groups.

10 FW - formula weight
GC - gas chromatography
GC/MS - gas chromatography followed by mass spectrometry
GPC - gel permeation chromatography
15 MeOH - methanol
PMAO - polymethylaluminoxane
RT - room temperature
THF - tetrahydrofuran

Experiment 1

20 2,6-Diacetylpyridinebis(2-chloro-6-methylphenylimine)

In a 200 mL round bottom flask, 2.0 g of 2,6-diacetylpyridine (FW 163.18, 0.0122 mole) and 50 mL of methanol were placed. Next, 3.45 g of 2-chloro-6-methylaniline (FW 141.60, 0.0245 mole) was
25 added followed by three drops of formic acid and the solution was stirred at RT under nitrogen for four d, at which time no precipitate had formed. The reaction was then refluxed for 24 h. GC analysis indicated that reaction was incomplete. Refluxing was continued for a
30 total of 1 week. Solvent was stripped from the reaction mixture via rotovap. Flash chromatography through a basic alumina column (eluted with hexane/ethyl acetate 20:1) lead to isolation of an oil. The oil was then crystallized from methanol/methylene
35 chloride. Collected 0.21 g (4.2% yield) of pale yellow crystals. ¹H-NMR (ppm, CDCl₃): 2.12(s, 6H), 2.32(s, 6H), 6.95(t, 2H), 7.13(d, 2H), 7.30(d, 2H), 7.92(t, 1H), 8.5(d, 2H).

Experiment 22,6-Diacetylpyridinebis(2-biphenylimine)

In a 100 mL round bottom flask, 0.48 g of 2,6-diacetylpyridine (FW 163.18, 0.00295 moles), 1.0 g of 2-aminobiphenyl (FW 169.23, 0.0059 moles), and 20 mL of methanol were placed. Three drops of formic acid were added and the resulting solution stirred under nitrogen. A precipitate formed after one day. This was filtered off, washed with cold methanol and dried. Collected 0.84 g (61% yield) of pale yellow solid. ¹H NMR (ppm, CDCl₃): 2.15(s, 6H), 6.8(d, 2H), 7.15-7.50(m, 16H), 7.75(t, 1H), 8.10(d, 2H).

Experiment 32,6-Pyridinedicarboxaldehydebis(2,6-diisopropylphenylimine)

In a 35 mL round bottom flask, 0.28 g of 2,6-pyridinedicarboxaldehyde (FW 135.12, 0.00207 moles), 0.73 g of 2,6-diisopropylaniline (FW 177.29, 0.00414 moles), and 15 mL of methanol were placed. Three drops of formic acid were added and the solution stirred. A precipitate formed within 5 min. Stirring was continued overnight. The solid was filtered off, washed with cold methanol and dried. Collected 0.86 g (91.5% yield) of a pale yellow solid. ¹H NMR (ppm, CDCl₃), 1.2(d, 24H), 3.0(m, 4H), 7.0-7.2(m, 6H), 8.0(t, 1H), 8.35(s, 2H), 8.4(d, 2H).

Experiment 42,6-Diacetylpyridinebis(2-tert-butylphenylimine)

In a 200 mL round bottom flask, 2.0 g of 2,6-diacetylpyridine (FW 163.18, 0.0122 moles) was dissolved in 25 mL of methanol. Next 3.66 g of 2-tert-butylaniline (FW 149.24, 0.0245 moles) and 3 drops of formic acid were added. A precipitate started to form after 30 min. The solution was stirred at room temperature overnight. The precipitate was filtered off, washed with cold methanol and then dried. Collected 3.88 g (75% yield) of a yellow solid. The NMR revealed the solid to be mostly the monoimine

product. The above solid (3.85 g, FW 294.4, 0.013 mole) was placed into a 200 mL flask. 1.95 g of 2-t-butylaniline, methanol, and 4 drops of formic acid were added. The mixture was brought to reflux before
5 slowly adding chloroform until all solids had dissolved. After 48 h the volume was reduced and the reaction cooled to precipitate more solids. These were isolated and recrystallized from methanol and a minimum amount of chloroform, yielding 2.8 g of product.
10 ¹H-NMR (ppm, CDCl₃) 1.4(s, 18H), 2.4(s, 6H), 6.55(d, 2H), 7.1(t, 2H), 7.2(t, 2H), 7.45(d, 2H), 7.9(t, 1H), 8.4(d, 2H).

Experiment 5

15 [2,6-Diacetylpyridinebis(2-chloro-6-methylphenylimine)]cobalt[II]dichloride

In a dry, oxygen-free atmosphere CoCl₂ (anhydrous, 0.062 g) was dissolved in a minimum of dry THF. 2,6-Diacetylpyridinebis(2-chloro-6-methylphenylimine) (0.205 g) was added and the solution turned green and a
20 green precipitate formed. The mixture was stirred at RT for 2 days after which the volume of the solution was reduced by half and pentane added to precipitate the product, which was filtered off, washed with pentane and dried. Yield 0.240 g.

25 Experiment 6

[2,6-Diacetylpyridinebis(2-biphenylimine)]cobalt[II]dichloride

In a dry, oxygen-free atmosphere CoCl₂ (anhydrous, 0.135 g) was dissolved in a minimum of dry THF. 2,6-Diacetylpyridinebis(2-biphenylimine) (0.500 g) was
30 added and the solution darkened and a brown precipitate formed. The mixture was stirred at RT for 2 d after which the volume was reduced and pentane added. The product was filtered off, washed with pentane and
35 dried. Yield 0.500 g.

Experiment 7[2,6-Pyridinedicarboxaldehydebis(2,6-diisopropylphenylimine)]cobalt[II]dichloride

In a dry, oxygen-free atmosphere CoCl_2 (anhydrous,
5 0.072 g) was dissolved in a minimum of dry THF.
2,6-Pyridinedicarboxaldehydebis
(2,6-diisopropylphenylimine) (0.256 g) was added and
the solution darkened and turned green. The mixture
was stirred at RT for 4 d after which the volume was
10 reduced and pentane added. The product was filtered
off, washed with benzene and pentane and dried. Yield
0.26 g.

Experiment 8[2,6-Diacetylpyridinebis(2-t-butylphenylimine)]cobalt[II]dichloride

In a dry, oxygen-free atmosphere CoCl_2 (anhydrous,
0.168 g) was dissolved in a minimum of dry THF.
2,6-Diacetylpyridinebis(2-t-butylphenylimine) (0.553 g)
was added and the solution darkened and a brown
20 precipitate formed rapidly. The mixture was stirred at
RT overnight after which pentane was added. The
product was filtered off, washed with pentane and
dried. Yield = 0.66 g.

25 In the Examples ^{13}C NMR spectra were obtained on a
Bruker DRX Avance 500 MHz instrument at 30°C with a
Nalorac 10 MM Probe using a 90 degree pulse, digital
filtering and digital lock, a spectra width of 29 kHz,
an acquisition time of 0.64 sec, and a delay between
30 pulses of 10 sec. Samples were 10 or 20 wt% in CDCl_3
with 0.05 M CrAcAc . A variety of 2D NMR experiments
were used to support the assignments, including HMQC,
HMBC, HSQC-TOCSY, and TOCSY.

In the examples, certain compounds having the
35 formula (II) are used as "Catalysts". In these
compounds, R^1 , R^2 and R^3 are hydrogen, n is 2, and X is
Cl. The remainder of the substituents are given in
Table 1.

Table 1

Catalyst No.	R ⁴	R ⁵	R ⁶	R ⁷
1	Me	Me	2-phenylphenyl	2-phenylphenyl
2	Me	Me	2-chloro-6-methylphenyl	2-chloro-6-methylphenyl
3	H	H	2,6-diisopropylphenyl	2,6-diisopropylphenyl
4	H	H	2-phenylphenyl	2-phenylphenyl
5	Me	Me	2-t-butylphenyl	2-t-butylphenyl

Example 1

Inside a drybox under a nitrogen atmosphere, Catalyst 1 (12.4 mg, 0.02 mmol) was slurried in anhydrous toluene (25 ml) in a Schlenk flask. The flask was sealed, removed from the drybox and placed under an atmosphere of propylene (35 kPa) and cooled to 0°C. The cocatalyst, PMAO (0.5 ml, 9.3wt% Al in toluene, Akzo), was added with vigorous stirring and the reaction allowed to proceed at 0°C for 5 h after which it was warmed to RT and allowed to react for a further 16 h. The reaction was quenched by addition of MeOH/10% HCl and the toluene phase decanted. Toluene and the lower molecular weight oligomers (up to and including a major portion of the C₉ fraction) were removed under vacuum. The remaining oligomers were analyzed using, GC, GC/MS and ¹³C-NMR. Yield = 2.3g

	Species	Mol%
20	1-ene	8.9
	2-ene trans	30.1
	2-ene cis	16.2
	3-ene trans	1.5
	3-ene cis	ND
25	4-ene trans	18.1
	2-methylene	1.5
	3-methylene	ND
	4+-methylene	1.3
	5+-ene	22.5
30	% Me per ene	3
	1B1/1000CH ₂	~3

ND = not detected

% Me per ene: number of methyl branches per double bond occurrence.

1B1/1000 CH₂: number of methyl branches per
5 1000 CH₂.

Example 2

Inside a drybox under a nitrogen atmosphere, Catalyst 2 (32 mg, 0.06 mmol) was slurried in anhydrous toluene (25 ml) in a Schlenk flask. The flask was
10 sealed, removed from the drybox and placed under an atmosphere of propylene (35 kPa) and cooled to 0°C. The cocatalyst, PMAO (0.5 ml, 9.3 wt% Al in toluene, Akzo), was added with vigorous stirring and the reaction allowed to proceed at 0°C for 5 h after which
15 it was warmed to RT and allowed to react for a further 16 h. The reaction was quenched by addition of MeOH/10% HCl and the toluene phase decanted. Toluene and the lower molecular weight oligomers (up to and including a major portion of the C₉ fraction) were removed under
20 vacuum. The remaining oligomers were analyzed using, GC, GC/MS and ¹³C-NMR. Yield = 3.7g

The same species present in Example 1 are also present in this sample. The ND species are also the same. However, in this sample there are several
25 additional olefinic resonances. There are about 50-100 1B1 methyls per 1000 methylenes.

Example 3

Inside a drybox under a nitrogen atmosphere, Catalyst 3 (35 mg, 0.06 mmol) was slurried in anhydrous
30 toluene (25 ml) in a Schlenk flask. The flask was sealed, removed from the drybox and placed under an atmosphere of propylene (35 kPa) and cooled to 0°C. The cocatalyst, PMAO (0.5 ml, 9.3 wt% Al in toluene, Akzo), was added with vigorous stirring and the
35 reaction allowed to proceed at 0°C for 5 h after which it was warmed to RT and allowed to react for a further 16 h. The reaction was quenched by addition of MeOH/10% HCl and the toluene phase decanted. GC

analysis of this crude reaction product indicated the presence of a small amount of oligomer.

Example 4

Inside a drybox under a nitrogen atmosphere,
5 Catalyst 4 (34 mg, 0.06 mmol) was slurried in anhydrous
toluene (25 ml) in a Schlenk flask. The flask was
sealed, removed from the drybox and placed under an
atmosphere of propylene (35 kPa) and cooled to 0°C.
The cocatalyst, PMAO (0.5 ml, 9.3 wt% Al in toluene,
10 Akzo), was added with vigorous stirring and the
reaction allowed to proceed at 0°C for 5 h after which
it was warmed to RT and allowed to react for a further
16 h. The reaction was quenched by addition of
MeOH/10% HCl and the toluene phase decanted. GC
15 analysis of this crude reaction product indicated the
presence of a small amount of oligomer.

Example 5

Inside a drybox under a nitrogen atmosphere,
Catalyst 5 (33 mg, 0.06 mmol) was slurried in anhydrous
20 toluene (25 ml) in a Schlenk flask. The flask was
sealed, removed from the drybox and placed under an
atmosphere of propylene (35 kPa) and cooled to 0°C.
The cocatalyst, PMAO (0.5 ml, 9.3wt% Al in toluene,
Akzo), was added with vigorous stirring and the
25 reaction allowed to proceed at 0°C for 5 h after which
it was warmed to RT and allowed to react for a further
16 h. The reaction was quenched by addition of
MeOH/10% HCl and the toluene phase decanted. GC
analysis of this crude reaction product indicated the
30 presence of a small amount of oligomer.

CLAIMS

What is claimed is:

1. A process for the oligomerization of propylene, comprising, contacting, at a temperature of about -100°C to about $+200^{\circ}\text{C}$, a compound of the formula

with propylene and:

- (a) a first compound W, which is a neutral Lewis acid capable of abstracting X^- and alkyl group or a hydride group from M to form WX^- , WR^{20} or WH and which is also capable of transferring an alkyl group or a hydride to cobalt, provided that WX^- is a weakly coordinating anion; or
- (b) a combination of a second compound which is capable of transferring an alkyl or hydride group to cobalt and a third compound which is a neutral Lewis acid which is capable of abstracting X^- , a hydride or an alkyl group from M to form a weakly coordinating anion;

wherein:

each X is an anion;

- n is 1, 2 or 3 so that the total number of negative charges on said anion or anions is equal to the oxidation state of a Co atom present in (II);

R^1 , R^2 and R^3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R^4 and R^5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R^6 and R^7 are aryl or substituted aryl; and

5 R^{20} is alkyl.

2. A process for the oligomerization of propylene, comprising contacting, at a temperature of about -100°C to about $+200^\circ\text{C}$, a Co[II] or Co[III] complex of a tridentate ligand of the formula

10

(I)

with propylene, wherein:

R^1 , R^2 and R^3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R^4 and R^5 are each independently hydrogen, hydrocarbyl, an inert functional group or substituted hydrocarbyl; and

20 R^6 and R^7 are aryl or substituted aryl;

and provided that a Co[II] or Co[III] atom also has bonded to it an empty coordination site or a ligand that may be displaced by said propylene, and a ligand that may add to said propylene.

25 3. The process as recited in claim 1 or 2 wherein:

R⁶ is

R⁷ is

R⁸ and R¹³ are each independently hydrocarbyl, substituted hydrocarbyl or an inert functional group;

R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵ and R¹⁶ are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl or an inert functional group;

R¹² and R¹⁷ are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl or an inert functional group;

and provided that any two of R⁸, R⁹, R¹⁰, R¹¹, R¹², R¹³, R¹⁴, R¹⁵, R¹⁶ and R¹⁷ that are vicinal to one another, taken together may form a ring.

4. The process as recited in claim 3 wherein:

R¹, R² and R³ are hydrogen;

R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵ and R¹⁶ are each independently halogen, alkyl containing 1 to 6 carbon atoms, or hydrogen;

R⁸ and R¹³ is each independently halogen, phenyl or alkyl containing 1 to 6 carbon atoms;

R¹² and R¹⁷ are each independently halogen, phenyl, hydrogen, or alkyl containing 1 to 6 carbon atoms; and

R⁴ and R⁵ are each independently hydrogen or alkyl containing 1 to 6 carbon atoms.

5. The process as recited in claim 4 wherein R⁹, R¹⁰, R¹¹, R¹⁴, R¹⁵, and R¹⁶ are each hydrogen.

6. The process as recited in claim 4 wherein R^8 and R^{13} are each alkyl containing 1-6 carbon atoms or phenyl, and R^{12} and R^{17} are hydrogen.

7. The process as recited in claim 6 wherein R^4 and R^5 are each hydrogen or methyl.

8. The process as recited in claim 4 wherein:

$R^1, R^2, R^3, R^9, R^{10}, R^{11}, R^{14}, R^{15}$ and R^{16} are hydrogen, R^8 and R^{13} are chloro, and R^4, R^5, R^{12} and R^{17} are methyl;

10 $R^1, R^2, R^3, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, R^4 and R^5 are methyl, and R^8 and R^{13} are phenyl;

$R^1, R^2, R^3, R^4, R^5, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, and R^8 and R^{13} are phenyl;

15 $R^1, R^2, R^3, R^4, R^5, R^9, R^{10}, R^{11}, R^{14}, R^{15}$, and R^{16} are hydrogen, and R^8, R^{12}, R^{13} and R^{17} are i-propyl; and

$R^1, R^2, R^3, R^9, R^{10}, R^{11}, R^{12}, R^{14}, R^{15}, R^{16}$ and R^{17} are hydrogen, R^4 and R^5 are methyl, and R^8 and R^{13} are t-butyl.

20 9. The process as recited in claim 4 wherein X is chloride, bromide or tetrafluoroborate.

10. The process as recited in claim 4 wherein said neutral Lewis acid is an alkyl aluminum compound.

11. The process as recited in claim 10 wherein
25 said alkyl aluminum compound is polymethylaluminumoxane.

12. The process as recited in claim 4 wherein said temperature is about -50°C to about 100°C .

13. The process as recited in claim 1 or 2
wherein a pressure of said propylene is about
30 atmospheric pressure to about 275 MPa.

14. The process as recited in claim 1 wherein R^{20} contains 1 to 4 carbon atoms.

INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 99/06817

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 C07C2/32

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P, A	WO 99 02472 A (BROOKHART MAURICE S ;UNIV NORTH CAROLINA (US); DU PONT (US); SMALL) 21 January 1999 cited in the application see claims	1
A	WO 96 23010 A (DU PONT ;UNIV NORTH CAROLINA (US)) 1 August 1996 cited in the application	

☐ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
